Eliott Velarde

Software Developer | TypeScript & Go

Lima, Peru | +51 944181210 | contact@eliottvelarde.com | linkedin.com/in/eliott-velarde | github.com/EliottV17

SUMMARY

Backend-focused Software Developer building REST APIs and concurrent services with TypeScript, NestJS, Go, PostgreSQL, Docker, and AWS EC2, with a focus on backend architecture and reliable data systems. Shipped a production uptime-monitoring platform with CI, automated testing, HTTPS, health checks, and SSRF/rate-limit protections. Comfortable working in remote teams.

SKILLS

Languages: TypeScript, JavaScript, Go, SQL

Frameworks: NestJS, Express, React

Databases: PostgreSQL, Redis, MySQL

Cloud & DevOps: AWS (EC2, Security Groups, Budgets), Docker, Docker Compose, Caddy, Linux (Ubuntu), GitHub Actions

Tools & Practices: REST APIs, JWT Authentication, Rate Limiting, SSRF Mitigation, Testcontainers, Git, Go testing, Jest, OpenAPI

WORK EXPERIENCE

Backend Developer (Project Collaborator) — Meevent, Remote *Apr 2026 – Jul 2026*

- Standardized API communication in a Java/Spring Boot backend by documenting REST endpoints with OpenAPI, reducing front-end integration time by 20%.
- Established integration testing pipelines using Testcontainers and automated coverage tools to ensure API reliability.
- Refactored backend error handling into a unified model with trace IDs, resolving status-code inconsistencies identified during code reviews.

Frontend Developer (Intern) — SimplyTechnologies, Remote *Jul 2025 – Dec 2025*

- Migrated Routeiq's web interface from a legacy stack to React with TypeScript, building components directly from Figma designs and reducing runtime type errors through strict typing.
- Worked with backend engineers to define API contracts, ensuring smooth integration across an international remote team.

PROJECTS

Sentinel — Distributed Uptime Monitoring Platform – sentinel.eliottvelarde.com *Jan 2026 - Present*

- Built and deployed a distributed uptime monitoring and observability platform with TypeScript, NestJS, Go, PostgreSQL, React, Docker, and AWS EC2: per-check latency, status codes, and errors, state-change alerts, and a public status page.
- Designed a decoupled NestJS REST API and independent Go worker (goroutines, bounded concurrency with channels, pgxpool) with an extensible checker registry; load-tested locally with 5,000 monitors (~79 checks/s, ~50MB peak worker memory) and measured the concurrency ceiling against slow targets.
- Hardened against SSRF and abuse: DNS resolution with IP validation and socket pinning (DNS-rebinding defense), blocked private/cloud-metadata ranges, redirect revalidation, rate limiting, per-user quotas, and JWT/Argon2 auth.
- Deployed on AWS EC2 (Ubuntu) with Docker Compose, Elastic IP, and Security Groups; Caddy reverse proxy with automatic HTTPS, healthchecks (including a worker heartbeat), daily PostgreSQL backups with tested restore, and AWS Budgets alerts.
- GitHub Actions CI with unit, integration, and end-to-end tests (250+), static analysis, and govulncheck across API, worker, and frontend.

IntelDigest — Article Ingestion & Analysis Engine *Jul 2026 - Present*

- Building an asynchronous article-analysis service in Go (PostgreSQL, Redis): the API returns 202 Accepted while a separate worker processes each job; LLM outputs (OpenRouter) are validated against typed structs before persisting.

EDUCATION

- Computing and Informatics — Cibertec | **Graduated 1st in cohort (cumulative merit ranking, 47 students)**
