

Eliott Velarde

Backend Software Engineer | TypeScript & Go

Lima, Peru | +51 944 181 210 | contact@eliottvelarde.com | linkedin.com/in/eliott-velarde | github.com/EliottV17

SUMMARY

Backend Software Engineer with hands-on professional experience building REST APIs, complemented by independent projects in TypeScript, NestJS, and Go focused on concurrency and distributed systems. Emphasis on clean architecture, efficient data modeling, and automated testing to ensure software maintainability. Proven track record working across collaborative remote teams, translating design and system requirements into production-ready code.

SKILLS

Languages: TypeScript, JavaScript, Go, SQL

Frameworks: NestJS, React, Express

Databases: PostgreSQL, PostGIS, MongoDB

Tools & Practices: REST APIs, JWT Authentication, Git, Docker, Testcontainers, testing(Go), Jest, OpenAPI, Scrum, CI/CD

WORK EXPERIENCE

Backend Developer — Meevent, Remote

Apr 2026 – Jul 2026

- Standardized backend API communication by implementing OpenAPI documentation for REST endpoints, reducing front-end integration time by 20%.
- Established robust integration testing pipelines using Testcontainers and automated coverage tools to ensure API reliability.
- Refactored backend error handling into a unified model with trace IDs; resolved status-code regressions identified in code reviews by migrating to semantically correct typed exceptions (401, 409, 404).

Frontend Developer (Intern) — SimplyTechnologies, Remote

Jul 2025 – Dec 2025

- Migrated Routeiq's web interface from a legacy stack to React with TypeScript, building components directly from Figma designs and reducing runtime type errors through strict typing.
- Collaborated closely with backend engineers to define API contracts, ensuring smooth integration across an international remote team.

PROJECTS

Sentinel API — Distributed Uptime Monitoring & Observability Platform — Project

Jan 2026 - Apr 2026

- Designed a decoupled architecture with a TypeScript/NestJS REST API and an independent Go worker daemon, coordinating concurrent polling directly over PostgreSQL to avoid the operational overhead of an external message broker.
- Built the Go worker using goroutines with bounded concurrency via channel-based semaphores and context propagation, alongside a pgxpool connection pool, to control parallel execution without overloading the network or database.
- Implemented an extensible Strategy/Registry pattern for health checkers, decoupling the validation engine from the dispatch loop so new verification protocols can be added without modifying the worker's core.
- Built a multi-service CI pipeline (GitHub Actions) with unit and end-to-end testing, static analysis, and automated vulnerability scanning (govulncheck) across the API, worker, and frontend services.

Gym Buddy — Location-Based Matching App — Personal Project

Jul 2026 - Sep 2026

- Designed the geospatial matching engine using PostGIS (geography type) with ST_Distance for real-time proximity queries, combining anti-joins and hierarchical ranking by distance and recent activity.
- Designed a normalized matching schema using sorted user-pair keys to prevent race conditions and duplicate matches at the persistence layer, ensuring relational consistency regardless of interaction order.

EDUCATION & CERTIFICATIONS

- Computing and Informatics — Cibertec (Graduated)
- Masterclass: System Design, Node.js, AWS & SQL — Academia X
